How to install Pro/Engineer Wildfire A: Pro E Wildfire 4.0 has been discontinued, which was mentioned on the PTC.com website, but it's worth pointing out that this is NOT a small release, and has been streamlined to keep it lean, and make it do more. The version that we used for the mass data migration project is Pro/Engineer Wildfire 4.0. So what does this latest version have in store for us and how should we install it? And does it perform better than the old version of Pro E Wildfire? Let's see. What's New in Pro/Engineer Wildfire 4.0 Pro/CAM is integrated into Pro/ENGINEER Wildfire 4.0. You can, therefore, use the CAM and PROCAM tools together. This means you can work on any model part with any CAM or PROCAM tool, and PRO/ENGINEER Wildfire will be able to display it, quickly, and be able to work with it. Support for Design Wall 3D building was added. Buildings can be added into new assembly modules and saved in the associated *.dmw file. The module will be saved into the building model on project load and closed as a separate assembly module. MATLAB-based calculations are supported. You can run MATLAB scripts and perform parametric calculations in association with a part file. Support for dimple mold was added. Dimensions of dimples can be configured and exported to XML and HTML files. Pro/INTRALINK, Pro/SIMULINK, Pro/Dynamics, and Pro/Flexibility modules were integrated into the PRO/ENGINEER Wildfire 4.0. Installing Pro E Wildfire If you have a paid PRO/ENGINEER Wildfire subscription, you don't need to download and install the version of Pro E Wildfire for your system. All you need to do is to log in to your PRO/ENGINEER Wildfire site and click on Update to be able to download the latest version of Pro E Wildfire. First, please use the following to download the latest version of Pro E Wildfire. Do NOT forget the leading / at the beginning of the URL.
